Home Care Services Management System

Abstract:

The Home Care Services Management System is a Python application designed to streamline the management of home care services. It provides a platform for administrators, users (clients/patients), and nurses to interact efficiently, ensuring seamless coordination and delivery of care services.

Modules:

1.Admin Module:

Authentication: Allows administrators to log in securely to the system.

Dashboard: Provides an overview of system activities, including pending requests, user statistics, and nurse availability.

User Management: Enables administrators to add, modify, or remove users (clients/patients) and nurses from the system.

Service Management: Allows administrators to define and update the types of services offered, along with their pricing and availability.

Reporting: Generates reports on various aspects such as service utilization, revenue, and user feedback.

Settings: Provides options to configure system parameters such as email notifications, payment gateways, etc.

2.User Module:

Registration/Login: Allows users to create accounts or log in securely.

Profile Management: Enables users to update their personal information, medical history, and preferences.

Service Request: Allows users to request home care services, specifying the type of service required, preferred time slots, etc.

Booking Management: Provides access to view and manage existing service bookings, including scheduling changes or cancellations.

Feedback: Allows users to provide feedback and ratings for the services received.

3.Nurse Module:

Registration/Login: Allows nurses to create accounts or log in securely.

Availability Management: Enables nurses to set their availability schedules based on their working hours and preferences.

Service Assignment: Provides nurses with details of assigned service requests, including patient information, service type, and schedule.

Service Execution: Allows nurses to update the status of service execution, mark completion, and provide necessary documentation or notes.

Feedback: Enables nurses to view feedback and ratings provided by users and respond if necessary.

4.Notification Module:

Sends email or SMS notifications to users, nurses, and administrators regarding service requests, bookings, schedule changes, feedback reminders, etc.

5.Payment Module (Optional):

Integrates payment gateways to facilitate online payment for services rendered. Allows users to view payment history.
